The ESET difference

ADD LAYERS OF PROTECTION AGAINST THREATS

ESET Anti-Malware SDK was built on ESET's proven multilayered detection. All the components work together to create an impenetrable wall for all types of threats, be it phishing sites, ransomware, Trojans or keyloggers. The highly effective scanning engine covers multiple attack vectors, from malicious code attempting to infiltrate the system, to that found on the disk, the Master Boot Record (MBR) or that running in the memory.

DNA DETECTIONS

One of the protection layers, DNA Detections, identifies specific known malware samples, new variants of a known malware family, or even previously unseen or unknown malware which contains genes indicating malicious behavior.

IN-PRODUCT SANDBOX

Greatly improves detection by executing suspicious data in an in-product sandbox. Uses binary translations to keep sandboxing effective, yet lightweight.

WORKS WITH WINDOWS AND LINUX

Support for both Windows and Linux platforms is ensured. Includes native 64-bit engine.

ALSO DETECTS MOBILE AND MAC MALWARE

While the SDK works on Windows and Linux, the scanning engine also blocks mobile (Android, iOS) malware and threats targeting macOS, providing for a fully fledged cross-platform protection.

COMPLETE CONTROL

Your organization has full control over the implementation process and which functionality you decide to use. The solution offers a wide range of options, supported with extensive documentation and ESET engineers ready to assist you in case you need help.

SCANS FILES AND BLOCKS OF DATA

Analyzes hundreds of different file formats (executables, installers, scripts, archives, documents and bytecodes, as well as blocks of data) in order to accurately detect embedded malicious components.

URL AND IP ADDRESS SCANNING

ESET Anti-Malware SDK also provides URL and IP address scanning to identify and block phishing sites and addresses containing dangerous payload.
